MI 449 Final Project Pre-Production Document Ulas Kaygisiz

Project Statement

This Country Information page draws inspiration from a childhood game where I used to identify countries by their flags. Unlike the game, this single-page website operates inversely by providing detailed information about a country's flag and population when a user clicks on a map location. Utilizing the Google Maps API, the website captures geographic details based on user interaction, and with the REST Countries API, it displays the flag, population, and a descriptive narrative of the flag for the selected country. This design allows users to access essential information about any country, even if they initially do not know which country they have clicked on, enhancing geographical knowledge and engagement in an interactive manner.
